ACKNOWLEDGEMENT

First of all thanks to Almighty ALLAH for blessing us with the strength and courage that results this thesis as you are probably aware that, developing a project is never an effort undertaken solely by developer, who gets all the credit on many people contributed and helped to encourage us in great many ways.

We wish to express our sincere gratitude to our worthy supervisor **Muhammad Khalid** for his guidance, support, and advice in the project. His patience and encouragement was the source of inspiration for us.

We should also like to express our deepest gratitude to our project Coordinator **Burhan Ahmed** for his advices, encouragement, guidance, help, ideas, co-operation, and kindness. Despite his tight schedule, he still manages to contribute significantly.

We should also like to express our deepest gratitude to our sir **Masood Usman** for his advices, encouragement, guidance, help, ideas, co-operation, and kindness.

Finally, we would like to thanks our loving parents, because without their continuous support neither we were able to bear the tribulation nor the finance, we would also like to give special thanks to our other family members and friends for the continuous encouragement and support.

ABSTRACT

Enormous progress in the field FIELD Programmable Gate Array (FPGA) has made it easy to design, simulate and synthesize complex digital world applications with greater performance, low cost, low power consumption and a high level of configurability: especially complex DSP applications has been the main beneficiary of FPGA designs. The FPGA designer tends to choose the word accuracy for the realization of a design object of the economic system.

FPGAs have provided a unique and exclusive support for the design of complex digital systems on a single chip with the lowest energy consumption as compared to other technologies such as ASIC.

Because of the considerable progress in the field of FPGA-based applications around the world design, we decided to work in this field for the fulfillment of the requirement of the project last year. With respect, we tried to design, simulate and synthesize the actuator interfacing with the Xilinx Spartan 3E FPGA Development Board. With advice that we can control the angle servo motor and the servo motor speed. Using servo motor we designed the robotic and all movements robot arm can be controlled by servo arm.

The design was programmed using hardware description language (VHDL). The application was simulated, synthesized and tested on a small commercial FPGA using ISE Suite.

TABLE OF CONTENTS

1. Introduction	4
1.1 Motivation.....	
2. Background and Literature Review	7
2.1 INTRODUCTION TO FPGA.....	7
2.1.1 PLA.....	7
2.1.2 FPGA ARCHITECTURE.....	8
2.1.3 FPGA COMPARISON.....	11
2.1.4 APPLICATIONS OF FPGA.....	10
2.5 WHAT IS SERVO MOTOR.....	11
2.5.1 CONSTRUCTION	13
2.5.2 CONTROL SIGNAL PULSE.....	14
2.5.3 SERVO(TORQUE).....	15
2.5.4 SERVO POWER.....	16
2.5.5 TYPES OF SERVO.....	17
3. Aim and Statement of Problem	22
3.1 WHY ROBOTIC ARM.....	24
3.2 HOW ROBOT ARM MOVES	24
3.4 ROBOTS PARAMETERS	25
4. Analysis and Design	28
4.1 FPGA.....	34

4.2	7805 (voltage regulator).....	38
4.3	4N25 OPTO COUPLERS.....	40
4.4	2N2222 TRANSISTOR.....	41
5.	Implementation.....	42
5.1	SCHEMATICS.....	42
5.1.1	TECHNOLOGY VIEW.....	46
5.1.2	TIMING DIAGRAM.....	49
5.1.3	FLOW CHART.....	51
5.2	HARDWARE DESCRIPTION.....	52
5.2.1	2N2222A.....	
5.2.2	7805 VOLTAGE REGULATOR.....	
5.2.3	FPGA SPARTRAN 3.....	52
5.2.4	FPGA KIT PROGRAMING PROCESS.....	53
6	APPLICATIONS.....	53
7	CONCLUSION.....	54
8	FUTURE WORK.....	55
9.	APPENDIX: A	
	DATASHEET.....	56
	APPENDIC: B	
	CODING.....	68
	REFERENCE.....	72
