ABSTRACT

In the current study, Pakistan's natural gas energy consumption, cost and emission were foreseen for the next thirty years. Study used 2012 as base year while 2042 as the end year. Prime objective of this study was to develop a fully incorporated modeling scheme and to find out ways to minimize negative environmental impacts governed by poor energy utilization practices. Another important objective was to promote indigenous energy sources in order to reduce growing natural gas import loads. It was carried out in assistance of Long Range Energy Alternative Planning System or LEAP. LEAP forecasted Pakistan's natural gas consumption, cost and related six major emissions to the environment. Secondary data was collected and interpreted to the LEAP. Model depicted results in the form of different scenarios. Such scenarios were actually self-consistent story-lines to estimate future natural gas energy evolution over time. At first, a scenario called Business-as-Usual (BAU) or base scenario was constructed by using base year i.e. 2012. It was based on likely plans and policies revealing future energy situation carried on the same existing energy track. Later, alternative scenarios i.e. biofuel scenario (BIO), nuclear energy scenario (NUC) and renewable energy scenario (REN) were framed. Among these, REN scenario particularly encouraged formulation of new energy policy and enforcement to reduce natural gas energy consumption and environmental emissions such as CO₂ (non-biogenic), CO, CH₄, NO_x, N₂O and VOC_s while BIO and REN both were found to be natural gas energy cost efficient. Finally, recommendations were considered for governmental, non-governmental and policy makers to make planned, wise and efficient use of natural gas energy to control environmental emissions by developing a pollution reduction framework.

ACKNOWLEDGEMENTS

In the name of Allah, the only Lord, the most powerful and the merciful, blessed me with knowledge, potential and ability to accomplish this task.

I would like to oblige my Supervisor, Mr. Khubaib Abuzar, Assistant Professor, Department of Earth and Environmental Sciences at Bahria University, Islamabad and Co-supervisor, Dr. Sheikh Saeed Ahmad, Associate Professor, Department of Environmental Sciences at Fatima Jinnah Women University, The Mall Rawalpindi, for their supervision, guidance and encouragement. I would like to express my gratitude to Ms. Rabia Shabbir, Lecturer, Department of Environmental Sciences at Fatima Jinnah Women University for her help and counseling in completion of my research work. I am grateful to Dr. Mohammad Zafar, Head of Department and Prof. Dr. Tahseenullah Khan, Earth and Environmental Sciences, Bahria University, Islamabad to review my thesis and furnish me with fruitful suggestions and feedback.

In addition, my deepest appreciation would go to my family for their prayers, moral support, care and love for me. Last but not least, I would like to acknowledge Ali Amin, Arif Rahman, Saima Tariq and Mahwish Khan who deserve to be thanked for being my strength and made university period an unforgettable time for me.
