

MASTERS DISSERTATION

Automated Service Selection Algorithm in Cloud Computing

*By
Hassan Bin Naseer*

*Supervised by
Dr. Irfan ul Haq*

**BAHRIA UNIVERSITY
ISLAMABAD**

*Dissertation submitted in partial fulfillment of the requirement for the degree of Masters in Software Engineering
(MSSE)*

APPROVAL SHEET

This is to certify that we have examined this copy of the Master's thesis written by **Hassan Bin Naseer** and have found that it is complete and satisfactory in all respects and that any and all revisions required by the final examining committee have been made.

Head of Department

Supervisor

Examining Committee:

Internal Examiner

External Examiner

DECLARATION

In presenting this thesis in partial fulfillment of the requirements for the Master's degree at the Bahria University Islamabad, I agree that the Library shall make its copies freely available for inspection. I further agree that extensive copying of this thesis is allowable only for scholarly purposes, consistent with fair use as prescribed in the Government of Pakistan Copyright Law. Any other reproduction for any purposes or by any means shall not be allowed without my written permission.

Table of Contents

Chapter 1: Introduction.....	7
1.1 Thesis Statement	7
1.2 Motivation.....	7
1.3 Objectives	7
1.4 Contributions	8
Chapter 2: Background	9
2.1 Cloud Computing	9
2.2 Service Models of Cloud	9
2.2.1 Software as a Service.....	10
2.2.2 Platform as a Service.....	11
2.2.3 Infrastructure as a Service.....	12
2.3 Implementation Models of Cloud.....	14
2.3.1 Public Cloud	14
2.3.2 Private Cloud	15
2.3.3 Hybrid Cloud.....	16
2.3.4 Community Cloud	16
2.4 Service Oriented Architecture of Cloud	17
2.5 Multi-Tenancy in Cloud Computing	18
2.6 Scalability	20
2.7 Configurable.....	21
Chapter 3: Related Work.....	22
3.1 Services in Cloud Computing	22
3.2 Quality of Service (QoS) Attributes in Cloud Computing	22
3.3 Service Level Agreements (SLAs)	23
3.4 Selection of Services.....	23
3.5 Overview of Service Selection Approaches	24
3.5.1 Customer-Service Requirement	24
3.5.2 Provider-Service Offerings.....	24
3.5.3 Service Selection Process	25
Chapter 4: Theory and Implementation.....	27

4.1	Scenario	27
4.2	Formal Representation.....	27
4.2.1	Service Attribute	27
4.2.2	Service Class.....	28
4.2.3	Service.....	28
4.3	What is a Knapsack Problem?	28
4.3.1	Mathematical Notation.....	29
4.3.2	Variations of Knapsack Problem.....	29
4.4	Solutions for Knapsack Problem	29
4.5	Simulated Annealing	30
4.6	Pseudo code for Algorithm.....	31
Chapter 5: Implementation and Results.....		32
5.1	Screenshots	32
5.2	Data Sets.....	34
5.2.1	Data Set # 1.....	34
5.2.2	Data Set # 2.....	34
5.2.3	Data Set # 3.....	7
5.2.4	Data Set # 4.....	8
5.2.5	Data Set # 5.....	9
5.3	Results	7
5.3	Results of Algorithm	9
5.4	Comparison with Other Algorithms.....	9
5.3.1	Graphs.....	10
5.5	Effect of Changing the Number of Iterations	15
5.5.1	Value – Time Graph.....	15
Chapter 6: Conclusions.....		17
6.1	Using Happiness Measure of User.....	17
6.2	QoS Aware Service Selection	17
6.3	Using Greedy Approach in Simulated Annealing	17
6.4	Future Work	18
References.....		19

Abstract

Cloud computing has created a buzz in the field of computing due to its service oriented architecture. It allows individuals and businesses to use software and hardware managed by third parties at distant locations.

However the growth of cloud computing has brought about the increase in cloud vendors and service providers offering variety of services to end users. The diversity in cloud platforms and services has made it difficult to decide which service to choose depending upon varying needs and constraints.

Quality of Service (QoS), attributes help us in examining the quality of a service that a vendor provides. However selecting the best service under certain conditions is still a cumbersome task. The Process is considered to be NP-hard (Non-deterministic Polynomial-time hard) problem as there is no ultimate solution.

This thesis addresses the challenge of finding near-optimal solutions of the problem, with reduced computational complexity, and is suitable for selecting services in real-time. In order to achieve this goal, user requirements are given top priority and happiness measure of user is calculated upon which services are filtered. Simulated Annealing algorithm along with greedy approach is used to determine to find the near optimal solution with time efficiency.

A formal model is used to calculate weights for each service according to user requirements and priority for each service class which plays a major role in increasing the satisfaction level of a user and helps in filtering the services that makes the algorithm work fast.

Enhanced service selection algorithm can reduce latency and help achieve higher level of user satisfaction in cloud computing environment.
