Abstract

The project named KAP is developed for a Faisalabad-based garments factory for the automation of their everyday generic kind of Business Process. The pressing needs of the factory for management of their ever-expanding information made the basis of this project.

KAP is developed as a plug-able module to the already functioning pool of systems of that factory. It takes care of every single thing related to the Buying/Selling Process. This involves everything from sample development to garments production, quality control and shipments of the factory goods. It also handles basic auditing issues raised at this level. Being an Information System in nature the project has a reporting interface also, which provides a broader view to the factory's business-critical data.
