**CERTIFICATE OF ORIGINALITY**

This is to certify that the intellectual contents of the thesis

**WELL LOGS BASED PETROPHYSICAL ANALYSIS AND NET PAY  
ESTIMATION, FIMKASSAR AREA, POTWAR SUB BASIN, PAKISTAN**

are the product of my own research work except, as cited properly and accurately in the acknowledgements and references, the material taken from such sources as research papers, research journals, books, internet etc. solely to support, elaborate, compare and extend the earlier work. Further, this work has not been submitted by me previously for any degree, nor it shall be submitted by me in future for obtaining any degree from this university, or any other university or institute. The incorrectness of this information, if any, proved at any stage, shall authorize the university to cancel my degree.

## **ABSTRACT**

The Eocene reservoirs including Chorgali and Sakesar formations are considered the main source of hydrocarbons in the Fimkassar Oil Field, Potwar Sub basin, Pakistan. This study is intended towards estimating Petrophysical properties including Volume of Shale, Porosity (Average and Effective), Water Saturation and finally Hydrocarbon Saturation using well logs. These petrophysical properties were then used to estimate the Net pay thickness in the respective horizons in order to analyze and ascertain the best zones for performing Perforation and producing Hydrocarbons. This study has utilized well logs of Fimkassar-01 and Fimkassar-02 wells for estimating the petrophysical properties. Gamma ray log is used for estimating Volume of Shale, Neutron log, Sonic log and Density logs are used for estimating the porosities in both wells, Latero Log Deep and Average porosities are used to estimate resistivity of Water and finally Water Saturation. After estimating these properties, three cut offs were applied to these properties. A 30% cut off was applied to Volume of Shale, 4% cut off was applied to Effective porosity and 50% cut off was applied to Water saturation to finally estimate the Net pay thicknesses for Chorgali and Sakesar formations in both wells and the best zones were identified in both wells for perforation and the production of hydrocarbons.

## **ACKNOWLEDGEMENTS**

I am especially indebted to my supervisor Mr. Saqib Mehmood for giving me an initiative to this study and his inspiring guidance, dynamic supervision and constructive criticism helped me to complete this work in time. I would like to thank my all teachers especially Dr. Muhammad Zafar (HOD) for their valuable knowledge, assistance, cooperation, kind attention and guidance throughout the completion of my degree. I owe special thanks to Prof. Dr. Tahseenullah Khan who reviewed this research work and endowed me with his valuable time. I was privileged to have his knowledgeable and keen guidance which helped me to convert my thesis draft into the present manuscript.

I also acknowledge the help, encouragement, endless love, support and prayers of my family, which have always been a source of inspiration and guidance for me all the way.

Last but not the least, I would like to thank my friends for being a great support and help, during the course of this research and during the whole Master's program.
