ABSTRACT

The aim of the present study was to investigate the effect of gender on procrastination. It was hypothesized that there would be a significance difference between male and female on procrastination. For this purpose a sample of 100 students, 50 males and 50 females between the ages of 18 to 35, was taken from private and government universities of Karachi. General Procrastination Scale (Lay, 1986) was employed to measure procrastination in students. The results were statistically analyzed by using SPSS 21 version. Gender differences and tendency of procrastination among university students was analyzed through independent sample t-test ($t=0.62$). This revealed that most of the students procrastinate in their academics, but there was no significant gender differences ($p=0.41$) exist in students on procrastination. Thus, it is concluded that there is no difference exist in male and female procrastination level.
