

Abstract

The purpose of study is to find the hydrocarbon potential of well, by evaluating their well logs which include, Porosity calculation, Shale volume calculation, Water saturation calculation, Permeability and to resolve lithology.

The results showed that the Khewra Sandstone is main reservoir rock. The Khewra contains 10.67% average porosity, shale volume is 26.92% and water saturation is 25.96%. The porosity was calculated from the combination of bulk density (RHOB) and neutron porosity (NPHI) logs, shale volume was calculated from GR linear equation while water saturation was calculated from Indonesia equation.

The study represents that the well has potential to produce hydrocarbon.

Acknowledgement

I am richly grateful to the God almighty for his beneficence and mercy which reposed the confidence in me to get through this arduous effort of compiling my age long learning into this work of thesis.

I must not forget my family and my friends who kept me in good spirits and provided and emotional equilibrium which lead me to an in fatigable discovery not only of my literary capabilities but also of my resilience and diligence.

Technically, I am greatly indebted to the guiding influence of Mr. Saqib Mehmood and Mr. Tausif who guided me step by step towards ultimate completion of this treatise.
