DEDICATED TO
MOTHERS AND HYDROGEOLOGISTS

ABSTRACT

The study area is located in Chenab Nagar, Chiniot, Punjab. Groundwater has been explored using electrical resistivity survey, physicochemical and isotopic analysis. Groundwater table depth and subsurface geology has been studied by acquiring the subsurface resistivity data using ABEM SAS 4000 terrameter up to 100m by Schlumberger configuration and interpreted with the help of resistivity curves generated in IX1D software. The groundwater samples have been collected from the already present water wells as per guidelines given by the American Public Health Association (APHA). The samples have been analyzed for turbidity, pH, Electrical Conductivity (EC), Total Dissolved Solids (TDS), Calcium (Ca), Magnesium (Mg), Sodium (Na), Potassium (K), Bicarbonate (HCO_3), Chloride (Cl), and Sulphate (SO_4) from the Pakistan Institute of Nuclear Science and Technology (PINSTECH), Nilore, Islamabad. The lithologies determined by the electrical resistivity surveys suggest presence of confined and unconfined aquifers made up of Quaternary sand deposits separated by the clay confining layers. The water table is present at relatively shallow depth 10 to 45 m that makes it susceptible to contamination. The physicochemical parameters furnished that the groundwater quality is poor to marginal according to the World Health Organization (WHO). Correlation analysis of major cations and anions with TDS (Total Dissolved Solids) revealed that groundwater recharge source is similar for all samples. With the study of stable environmental isotopes ($\delta^2\text{H}$, $\delta^{18}\text{O}$) recharge source is identified as precipitation. Groundwater present in this area can be brought to use for public with the setup of proper treatment plants that do not add toxic materials to water.

ACKNOWLEDGEMENTS

Sincerest gratitude to supervisors Dr. Anwar Qadir, Assistant Professor, Department of Earth and Environmental Sciences, Bahria University, Islamabad and Mr. Muhammad Raiees Amjad, Lecturer, Department of Earth and Environmental Sciences, Bahria University, Islamabad for their advice, guidance, encouragement and most of all their support to carry out and carry on this research.

We owe thankfulness to Dr. Mirza Naseer Ahmad, HOD Earth Sciences Department, Nusrat Jahan College and PINSTECH Nilore Islamabad for providing us commodities that we required. We are very grateful to all Earth and Environmental Sciences, Bahria University, Islamabad faculty members who have been very kind to lend a hand in every step of learning and understanding.

Lastly, we are ever indebted of our parents who back us up in every step and hold us up in the moments of disbelief and provide us momentum to propel towards success in every field of life especially education.
