

**EFFICACY OF MINDFULNESS BASED COGNITIVE THERAPY (MBCT) FOR
STRESS REDUCTION WITH FEMALE NURSES**

By

Syeda Zahra Nayyer

A thesis presented to

Institute of Professional Psychology

Bahria University, Islamabad.

in partial fulfillment of the requirements

for the degree

Masters in Science of Clinical Psychology

August 2018

BAHRIA UNIVERSITY ISLAMABAD

APPROVAL SHEET

SUBMISSION OF HIGHER RESEARCH DEGREE THESIS

Candidate's Name: Syeda Zahra Nayyer
Discipline: Clinical Psychology (M.S)
Faculty/Department: Institute of Professional Psychology

I hereby certify that the above candidate's work including the thesis has been completed to my satisfaction and that the thesis is in a format of an editorial standard recognized by the faculty/department as appropriate for examination.

Signature(s):

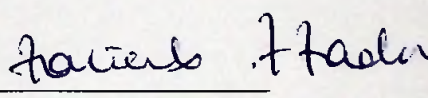

Principal Supervisor: 

Date: 18/09/18

The undersigned signifies that:

1. The candidate presented at a pre-completion seminar, an overview and synthesis of major findings of the thesis, and that the research is of a standard and extent appropriate for submission as a thesis.
2. I have checked the candidate's thesis and its scope, format, and editorial standards are recognized by the faculty/department as appropriate.

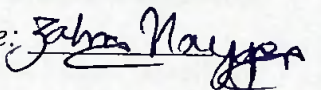

Signature(s):

Dean/Head of Faculty/Department: 

Date: _____

DECLARATION OF AUTHENTICATION

I certify that the research work presented in this thesis is to the best of my knowledge my own. All sources used and any help received in the preparation of this dissertation have been acknowledged. I hereby declare that I have not submitted this material either in whole or in part, for any other degree at this or any other institution.

Signature: 

Name: Syeda Zahra Nayyer

ACKNOWLEDGMENTS

Firstly, I am grateful to Allah for providing me with all the right tools and resources for the completion of this dissertation. This process would not have been completed without the constant support of my family members. I would also like to thank my supervisor Dr. Kiran Bashir Ahmad for guiding me throughout the process of writing this thesis.

I would also like to thank the administration and nurses working at hospital where I conducted my research work. Their enthusiasm during the sessions made working with them a worthwhile process. I feel it was not just them who benefitted from my research work but I also benefitted immensely from their experiences and feedback during the data collection process.

Finally, I would also like to thank my friends and teachers at Institute of Professional Psychology for assisting me, sometimes going out of their way in the process. Their valuable advice, moral support and guidance in terms of technical aspects of this thesis really helped in refining my work. I feel honored and blessed to be surrounded with such supportive friends and family members who supported my efforts throughout.

ABSTRACT

The purpose of this study was to investigate the efficacy of Mindfulness Based Cognitive Therapy on reducing perceived stress among female general practice nurses. The hypothesis forming the basis of this research was that there would be a significant level of difference in the pre-intervention and post-intervention perceived stress levels of the nurses. Furthermore, this study hoped to investigate whether MBCT acts as a coping mechanism for the participants and helps to lower perceived stress levels. For this study, the female nurses of ages between 25 to 45 years, who were working as general practice nurses at a local private hospital in Karachi were selected. The intervention consisted of 10 sessions in which Mindfulness Based Cognitive Therapy intervention was applied with the participants in a group setting. The intervention was applied in a single group consisting of 5 participants. The efficacy of the intervention was tested using the Perceived Stress Scale (PSS) by Cohen et. al (1988). This test was conducted with the participants of the intervention prior to the intervention being administered and immediately after the completion of the intervention. In addition, one on one interviews were also conducted with the participants after the completion of the intervention. The results showed that the paired sample t-test value of 2.794 which is statistically significant. Furthermore the mean difference of the total PSS scores before and after the intervention was 3.6 which again represents a significant change thus proving the efficacy of MBCT as means of reducing perceived stress among female general practice nurses.
