Automatic Lesion Detection System (ALDS) For Skin Cancer Classification

**MUHAMMAD MUHSIN SHAHBAZ
ALEENA NADEEM
SADIA KOUSAR**

Department of Computer Engineering

BahriaUniversity, Karachi Campus

Acknowledgments

In the name of ALLAH, the Most Gracious, the Most Merciful, at each beginning, we express our appreciation to Almighty ALLAH for showering his blessings and endowments upon us to finish this project.

Despite the fact that our names shows up on the front of this report. In any case, it would not have been conceivable without the kind backing and help of numerous people. We owe a considerable number because of a large number of individuals who helped and bolstered us amid the making of the project.

We are thankful to our **Engr. Naveera Sami**, supervisor of our project, for her steady motivation, bolsters, comprehension and significant help. They have taken the agony to experience the project and make vital adjustment as and when required .Express our appreciation to **Cdr. Muzammil Hussain, Director of Bahria University (Karachi Campus)** for his profitable proposals and advices all through the course. I likewise extend my gratitude to different faculty members for their participation amid my course.

We might want to extend our genuine because of our group members **Aleena Nadeem, Muhammad Muhsin Shahbaz, Sadia Kousar** for their endeavors and at long last I might want to thank my companions for their collaboration to complete this project.

More importantly, we might want to express gratitude toward Almighty Allah who made all things conceivable.

Abstract

The main goal of this project is to provide a medical field an embedded system through which they can easily find the mole's structure whether the mole is melanoma or non-melanoma

This report introduces how an **Automatic Lesion Detection System (ALDS) for Skin Cancer Classification** embedded system will be made into operation and how it will benefit its users. It will allow a doctor to perform an early detection of mole without going through the time consuming tests.

Automatic Lesion Detection System (ALDS) for Skin Cancer Classification. Electronic maintained examination urges oncologist to get a "second supposition" for evaluation and restoring of skin compromising improvement. Clear division of the hazardous mole close by including a territory is foremost for certified examination and confirmation. This is busy with the progress of improved ALDS dependent on both probabilistic and non-probabilistic approach and usages dynamic structures and watershed for segregating out the mole. After sore division, the huge highlights are sorted out to enroll that either the required case is dangerous ,straightforward mole or its probability of persuading the chance to be melanoma. The methodology is made progress toward various datasets and close examination is played out that mirrors the achievability of the proposed structure
