

ACKNOWLEDGEMENT

All commend is for the Almighty ALLAH, who is the root of all the mastery and intelligence blessed to the humanity, and to the Holy Prophet (PBUH) who demonstrated the light of apprehension to the entire humankind.

There are a number of people we would like to thank whose efforts made this project possible. All the group members have equally contributed and played a vital role in the success and achievement of the goal and credit cannot be given to an individual.

We are especially obliged to the people who guided and helped us to do this unwieldy assignment. These individuals include our supervisor Engr. M. Kashif Naseer, who believed in us and took our supervision, guided and contributed his specialized help at whatever point and wherever required. Our beloved parents who trusted and believed on us and provided us the financial we needed for the project. Their help was essential to the design and construction of the Wireless Power Transmission.

Ultimately we might want to thank all the faculty members of the Computer Engineering Department, Bahria University, Islamabad, for their help throughout the Degree. Apart from our faculty members we would also like to thank our classmates and friends for being with us in this journey and making it memorable.

ABSTRACT

Mobile phones have turned into a basic part of the modern-day lifestyle. Nowadays, almost everyone carries a phone in their pockets including young college students to multi-billionaire associates. With each and every passing day, the innovation associated with assembling the cell phones is improving. A massive amount of cash is spent for research purposes. One such research has been that, how to improve the battery life and how to shrink the size of the cell phone. However, with all the development in present-day innovation, in any case, despite everything we still need to connect our mobile phones to the wall socket for charging the battery of our mobile phones.

Recognizing this, our group thought of an interesting thought of charging the cell phone wirelessly, with no physical connection between the charger and mobile devices. The goal of our project is to charge the battery of a mobile device from the Radio Frequency(RF) which is produced by a transmitter coil (charger in this case) and received by the receiver coil connected to the cell phone. Other than charging the mobile phone, turning on a LED remotely has additionally been accomplished in this venture. The LED can be turned on at a more notable distance as compared to charging the cell-phone, as turning on a LED requires fewer power. This exploration based project presents a strategy of intriguing a remote charging system which can be utilized for the charging of our own use devices, for instance, mobile phones.

Keywords: WPT, WEPT, Portable charging, Energy Transfer.
